

## Physics D—Chapter 12

### Temperature and Heat

## Temperature

- Average kinetic energy of particles in a substance
- *Internal Energies*
  - include translational, rotational, and vibrational
  - Symbol => U
- Adding energy to a substance usually
  - Makes particles move faster
  - Raises the temperature

## Temperature Scales

Scale	Ice point	Steam point
Fahrenheit	32°F	212°F
Celsius	0°C	100°C
Kelvin (absolute)	273.15 K	373.15 K

## Temperature Conversions

$$T_F = \frac{9}{5}T_C + 32.0$$

$$T = T_C + 273.15$$

## Linear Thermal Expansion

- If the temperature of a solid increases so does its length
- All substances expand at different rates represented by a *coefficient of Linear Thermal expansion*— p. 351

$$\Delta L = \alpha L_0 \Delta T$$

## Volume Thermal Expansion

- If the temperature of a substance increases so does its volume
- All substances expand at different rates represented by a *coefficient of Volumetric Thermal expansion*— p. 351
- Water is an exception from 4° C to 0 ° C

$$\Delta V = \beta V_0 \Delta T$$

## Heat

- Energy transferred between objects because of a difference in temperature
  - Moves from hot to cold
  - You experience heat as sensations of cold or hot
  - Symbol => Q      Units => Joules
- Heat is **never contained in an object**; that would be....
  - **Internal Energy**

## Specific Heat Capacity

- Quantity of energy needed to raise the temperature of 1 kg of a substance 1° C
- Different for each substance—p.359
  - $c_{\text{water}} = 4186 \text{ J/Kg}\cdot^{\circ}\text{C}$
- Assumes constant pressure

$$c = \frac{Q}{m\Delta T} \quad Q = cm\Delta T$$

## Example Problem

- How much heat is needed to change the temperature of 50.0 g of water from 4.5 °C to 83.0 °C ?

## Example Problem

$$m = 0.0500 \text{ kg}$$

$$T_i = 4.5^{\circ}\text{C}$$

$$T_f = 83.0^{\circ}\text{C}$$

$$c_p = 4186 \text{ J/kg}\cdot^{\circ}\text{C}$$

$$Q = c_p m \Delta T$$

$$Q = 4186 \text{ J/kg}\cdot^{\circ}\text{C} (0.0500 \text{ kg}) (83^{\circ}\text{C} - 4.5^{\circ}\text{C})$$

$$Q = 16,400 \text{ J}$$

## Calorimetry

- Experimental procedure for measuring energy transferred in the form of heat

$$Q_w = -Q_x$$

$$c_{p,w} m_w \Delta T_w = -c_{p,x} m_x \Delta T_x$$

## Example Problem

- A 115 g mass of lead at 100.0 degrees Celsius is placed in a 220 g sample of water at 20.0 °C . What is the final temperature reached by the two substances?

### Example Problem

$$m_L = 0.115 \text{ kg}$$

$$T_{Li} = 100.0^\circ\text{C}$$

$$m_w = 0.22 \text{ kg}$$

$$T_{wi} = 20.0^\circ\text{C}$$

$$T_{wf} = T_{Lf} = T_f$$

### Example Problem

$$c_{p,w} m_w \Delta T_w = -c_{p,x} m_x \Delta T_x$$

$$c_{p,w} m_w (T_{wf} - T_{wi}) = -c_{p,x} m_x (T_{xf} - T_{xi})$$

$$4186(.22)(T_f - 20) = -128(.115)(T_f - 100)$$

$$921T_f - 18400 = -14.7T_f + 1470$$

### Example Problem

$$921T_f - 18400 = -14.7T_f + 1470$$

$$935.7T_f = 19870$$

$$T_f = 21.2^\circ\text{C}$$

### Warm-up Problem

- Vinegar, which contains acetic acid, can be used as an effective and environmentally-friendly household cleanser. Suppose you mix 0.340 kg of vinegar at 21.0 degrees Celcius with 1.00 kg hot water at 90.0 degrees Celcius in a plastic bucket. The solution of vinegar and water reaches a final equilibrium temperature of 73.7 degrees Celcius. Disregarding energy transfer as heat to the surrounding air and bucket, what is the specific heat capacity of vinegar?

- c-3810 J/kg·°C

### Phase Changes

- Temperature does not change during a phase change

### Latent Heat

- Heat required to cause a phase change
- Different for each substance – p. 364

- Solid => Liquid

$$Q = mL_f$$

- Liquid => Gas

$$Q = mL_v$$

### Example Problem

- A beaker with 25 g of ice at  $-12^\circ\text{C}$  is heated until it is water at  $25^\circ\text{C}$ . How much heat was required to complete this change?

### Example Problem

$$m = 0.025\text{kg}$$

$$T_i = -12^\circ\text{C}$$

$$T_f = 25^\circ\text{C}$$

$$c_{p,i} = 2.09 \times 10^3\text{ J/Kg}\cdot^\circ\text{C}$$

$$c_{p,w} = 4.186 \times 10^3\text{ J/Kg}\cdot^\circ\text{C}$$

$$L_{f,w} = 3.33 \times 10^5\text{ J/kg}$$

$$Q_{total} = Q_{ice} + Q_{melt} + Q_{water}$$

$$Q_{ice} = c_p m \Delta T$$

$$Q_{melt} = mL_f$$

$$Q_{water} = c_p m \Delta T$$

### Example Problem

$$Q_{ice} = c_p m \Delta T$$

$$Q_{ice} = (2.09 \times 10^3\text{ J/kg}\cdot\text{K})(0.025\text{kg})12^\circ\text{C}$$

$$Q_{ice} = 630\text{J}$$

### Example Problem

$$Q_{melt} = mL_f$$

$$Q_{melt} = 0.025\text{kg}(3.33 \times 10^5\text{ J/kg})$$

$$Q_{melt} = 8300\text{J}$$

### Example Problem

$$Q_{water} = c_p m \Delta T$$

$$Q_{water} = (4.186 \times 10^3\text{ J/kg}\cdot\text{K})(0.025\text{kg})25^\circ\text{C}$$

$$Q_{water} = 2600\text{J}$$

### Example Problem

$$Q_{total} = Q_{ice} + Q_{melt} + Q_{water}$$

$$Q_{total} = 630\text{J} + 8300\text{J} + 2600\text{J}$$

$$Q_{total} = 11500\text{J}$$
