

AT WAR

uch of our information about Greek soldiers comes from wr(  $oldsymbol{1}$  descriptions, pictures of Greeks at war on painted pottery and from discarded shields, weapons and armor found in large numbers of filled-in wells at Olympia. Though the Greeks could make iron, during the Peloponnesian wars many

shields weapons and breastplate: were still being made of bronze.

The main attacking formation was the phalanx, a square arrangement of foot soldiers (hoplites) armed with

spears around 3 to 4 meters in length. The leading t roops would hold their spears horizontally to present a moving front of spear points to the enemy, while the rear rows held their spears up to deflect enemy missiles. This formation was very effective in blocking a road or narrow rmountain pass.

Pavalry was sometimes used to protect an army's flanks or pursue fleeing enemy troops, but the mountainous Iterrain in Greece was not suitable for chariots when the city-states fought each other.

A Corinthian helmet from the city-State of Coruntii. Each region had at belimet of a different shape

arrows.

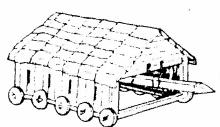

When soldiers were needed for battle, ordinary citizens made up the armies, which were led by aristocrats from wealthy families. Poor farmers or craftsmen used slings or bows while men who could afford armor became hoplites. Though the custom changed in later years, battles were usually fought in the summer months, the "fighting season," and during the 2nd Peloponnesian War fighting became more savage, with the whole populations of cities being slain or forced into slavery. Between the ages of 18 and 20, citizens became "ephebes" and could be made to do military service for their city-state. Slaves weren't citizens but often served as additional troops called "skimmishers," who protected the flanks of the phalanx with slings for hurling stones or with bows and

Ancient Greece

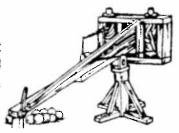

# **WEAPONS**

## **Battering Ram**

Mobile battering rams on wheels were used against the walls or gates of enemy cities. The ram, often a tree trunk with a metal point, was suspended on ropes under a protective cover and swung to and fro by a team of men.

#### Flame thrower

This Hellenistic flame thrower from the fourth century B.C. was used against wooden walls or gates. Huge bellows were worked by a team of men. They forced air through a hollow log and the increased oxygen caused the flames from burning coals in a metal cauldron to flare up and burn the target.

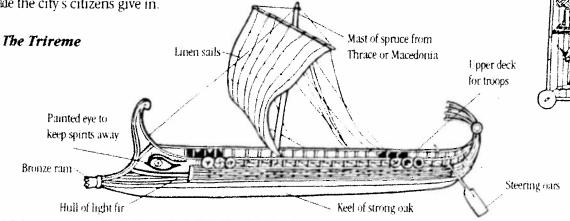

# The Catapult

The Greeks invented the catapult around 400 B.C. and, about 50 years later, the torsion catapult, where extra power came from tightly twisted ropes. Early catapults were similar to a crossbow and fired arrows or javelins, not rocks like later versions.

## Siege Tower

Siege towers enabled soldiers to scale the walls of besieged cities. Inside were different levels where archers firing arrows or catapults hurling rocks could break the resistance of a defending army. If the besieging army couldn't force a surrender, the siege could last months until starvation made the city's citizens give in.
